Tables of temperature, relative humidity, precipitation and sunshine for the world

PART III

Europe and the Azores

UDC 551.582.2(4)

Preface

Since the first edition of this work (Met.O.617—*Tables of temperature, relative humidity and precipitation for the world*) was published in 1958, the demand for climatic tables of this kind has increased from many sections of the community. To meet this demand the present edition of the work has been completely revised. All values for the elements previously given have been recomputed from more recent data, and the tables have been extended to include sunshine values wherever possible. Metric units have been used throughout the work to conform with present practice, but a set of comprehensive conversion tables have been included as appendices for the benefit of those readers who prefer to use the original units. A large number of places have been added to those given previously but a few have necessarily been deleted.

It was stated in the preface to the second edition that tables in future volumes would be arranged in geographical zones, but this scheme has been abandoned because of the weight of opinion in favour of retaining national boundaries. Each volume is arranged by listing the countries and the places within each country in alphabetical order.

The six volumes of the revised work are grouped in the following manner:

Part I	North America, Hawaii, Bermuda and Greenland.
Part II	The West Indies, Central and South America, the Falkland Islands and Antarctica.
Part III	Europe and the Azores.
Part IV	Africa and the surrounding oceans.
Part V	Asia.
Part VI	Australasia and the Pacific (excluding Hawaii).

Once again thanks are due to Mr P. J. M. Geelan of the Permanent Committee on Geographical Names, 1 Kensington Gore, London SW7 2AR, for his painstaking work in checking the spelling of all the place names used in this publication.

Thanks are also due to the Meteorological Service of the Irish Republic and to the Cyprus Meteorological Office for manuscript data which were prepared specifically for publication in this volume.

Explanatory notes

Period of years

The aim of this publication is to provide as much information as practicable within the standard climatological period 1931—60. Many of the tables are for this 30-year period but a large number are necessarily for a rather shorter period.

No attempt has been made to estimate missing data or to 'weight' the means to the standard period. Where tables are given for places for which data for the full 30-year period are not available, the averages are for as long a period as possible. In some cases the period has been extended beyond 1960 in order to obtain a reasonable number of years of record but in no case does the period extend back prior to 1931.

The overall period of years used in the preparation of each table is given in the table headings, but where unavoidable gaps occur in the observations, breaks of less than five years have not been specified. The actual number of years within the overall period for which data of each element could be used is shown at the foot of each column in the tables.

Sources of data

Recently published statistics of a country have been incorporated into this work if the period of years used was of a reasonable length and within the standard period 1931—60.

When means were not readily available the figures have been worked up from monthly, and in a few cases from daily, data published by the various countries.

Occasionally, where the above methods failed, tables or data have been requested from the Meteorological Service of the country concerned. Any information obtained in this way is acknowledged in the preface and listed in the bibliography as manuscript data supplied by the respective Meteorological Service.

The numbers which appear under 'Bibliography' at the top of the first column of each table refer to the references (sources of data) listed in the bibliography at the end of the volume. These references have been grouped under national headings to enable the reader to obtain a list of source books concerning the area in which he is interested without undue labour. This arrangement allows certain books to be referred to more than once, under different countries. Numbers are consecutive throughout.

Standard of time

The difference between the Local Mean Time (LMT) at any two places depends only on the difference in longitude between them. Since the earth makes one complete revolution in 24 hours, a difference of 15° in longitude corresponds to a time difference of 1 hour. In order to avoid the inconvenience which would arise if each place adopted its own LMT, the system of zone time was introduced and is now almost universally adopted. Under this system, national standards of time differ from one another by multiples of ½ hour or 1 hour, corresponding with 7½° or 15° of longitude.

Since the apparent motion of the sun is from east to west, the standard of time used in zones east of Greenwich is ahead of (i.e. a later time than) Greenwich Mean Time (GMT) and in zones west of Greenwich is behind (i.e. an earlier time than) GMT at the rate of 1 hour for every 15° of longitude.

All times given in the tables refer to the nearest standard meridian which is always in whole multiples of 7½° east or west of Greenwich. Thus, for a station in 71°W the time of 67½°W is used whereas for a station in 72°W the time of 75°W is used.

Position and height of stations

The positions (latitude and longitude) and heights of the stations (above or below mean sea level) are given at the top of each table. Some changes of site have occurred at a number of stations during the period of record used for the tables. However, in the case of the stations selected for inclusion in this work, the changes are not considered to be significant and are therefore not specified in the table headings, which give only the latest published position of each station.

Arrangement of tables and index

The tables have been arranged alphabetically within each country except in the case of very large countries where they have been arranged alphabetically within each state or province. Countries and states or provinces are arranged alphabetically as shown in the contents pages.

The index is arranged to facilitate reference. All cross references give the page number in order to avoid unnecessary searches. Where a place is known by more than one name an effort has been made to list all such names both in the index and in the table headings. However, alternative names which are not in current usage have been deliberately left out.

In the index, the names of countries, states or provinces are printed in capital letters and the names of places in ordinary type.

Temperature

The temperature values given in the tables are air temperatures taken in the shade, the thermometers being mounted, inside special screens, at between 1·2 and 2 metres above ground level.

Thermometer screens are designed to permit a free circulation of air around the thermometer bulbs and yet to afford shelter from precipitation, the direct rays of the sun, and heat radiated from the ground and neighbouring objects. The highest and lowest temperatures recorded during the 24 hours (between scheduled readings of the maximum and minimum thermometers) are known, respectively, as the daily maximum and daily minimum temperatures. The averages of these for each month and for the year as a whole are given in the tables. An approximation to the overall mean temperature for any month may be obtained by computing $\frac{1}{2}$ (mean daily maximum+mean daily minimum).

The extreme values in each month of the daily maximum and daily minimum temperatures are known as the monthly maximum and monthly minimum temperatures respectively; averages of these values are given in the tables, except that the entries for the year (marked with an asterisk) are averages of the highest and lowest temperatures recorded in each year, regardless of the month of occurrence.

The entries in the last two columns of temperature in the tables are the absolute extremes which have been recorded during the entire period of observational record, used in the table, for each place.

Relative humidity

The relative humidity is normally calculated at fixed hours of observation and, as a rule, it is impracticable to give maxima or minima, or values at the times of minimum and maximum temperature. For most stations, therefore, means at specified hours in the morning and afternoon have been given in the tables. Where a choice has been possible, the values given are for those hours which are nearest to the normal times of minimum and maximum daily temperature, i.e. about sunrise and in the early afternoon. Values for the morning hour of observation are mostly a little lower than the maximum relative humidity, the difference depending on the difference in time between the hour of observation and sunrise, and on which is the earlier. Values for the afternoon hour of observation are mostly a little higher than the lowest relative humidity, but for hours between 1200 and 1500 local apparent time the difference is generally small. Provided a suitable choice of hours has been possible, the values of mean daily maximum temperature and of the afternoon relative humidity are closely associated in time, and so are those for mean daily minimum temperature and the morning relative humidity. At a few places the local climate actually produces higher relative humidities in the afternoon than in the morning.

Precipitation

'Precipitation' includes any deposit of moisture from the atmosphere. Rain, snow and hail are by far the commonest forms of precipitation but other forms such as dew and hoar-frost do contribute to the amounts measured. The amounts of precipitation given in the tables indicate the amount of liquid deposit (rain, drizzle, dew) and the water equivalent of any solid deposit (snow, hail, hoar-frost, rime). The values are the depths to which a flat, level surface would be covered with water if there were no losses due to evaporation, run-off or drainage.

The terms '24 h' and 'days', in the table headings, refer to periods of 24 hours between scheduled readings of the rain-gauge and are not coincident with the civil day.

The entries in the column headed 'average No. of days with . . . mm' correspond to various definitions of a 'rain-day' or 'day with rain'. These definitions vary from country to country, but in each case the criterion on which the figures are based is stated at the head of the column.

Sunshine

Some of the values given for sunshine are subject to slight discrepancies because of the variety of recording instruments in use in different countries. Four main types of sunshine recorder are in use: (a) the Campbell–Stokes pattern, (b) the Marvin pattern, (c) the Jordan pattern and (d) the Foster pattern. Of these the Campbell–Stokes recorder has been adopted by the World Meteorological Organization as the 'interim reference sunshine recorder', and readings of all other instruments should be adjusted to agree with those of this standard recorder. Although most countries have compared their instruments (which have not been specified in this volume) with the Campbell–Stokes recorder, the results of these comparisons are not incorporated into this publication because the averages quoted have been derived from monthly or daily values published by the various Meteorological Services before comparisons were made.

In these tables, the 'average monthly duration' under 'Bright sunshine' refers to the average of the monthly totals recorded and the next column gives the percentage of this average recorded duration of the maximum possible average monthly total. The maximum possible average monthly total means the average maximum duration of sunshine which is theoretically possible with cloudless skies at the relevant latitude between sunrise and sunset (sunrise and sunset being defined as the instant at which the upper limb of the sun appears to be in contact with the horizon, the effects of elevation and topography being ignored). This possible monthly total cannot be recorded by the standard recorders in use today (except in high latitudes on occasions when the sun shines for 24 hours per day) because the sunshine is not strong enough to register on the recorder when the sun is less than about 3° above the horizon. The maximum duration of sunshine recorded on any day in each month irrespective of the year of occurrence is given in the tables as well as the average number of days in each month with no sunshine recorded.
